The present sequence represents part of the genome of a fulminant
Hepatitis B virus (FHBV) genotype D variant, nucleotides 1000 to 2500.
The specification describes Hepatitis B virus (HBV) nucleic acid that has
a mutation (i.e. alteration from the normal nucleotide in any of the
genotypes A to F) in at least two of the enhancer I region, the negative
c genotypes A to F) in at least two of the enhancer I region, the negative
c genotypes A to F) in at least two of the enhancer I region, the negative
c genotypes A to F) in at least two of the enhancer I region, the negative
c genotypes A to F) in at least two of the enhancer I region, the negative
c gentide amino acid change to Cys or Met. The HBV variants of the
c nvention are used to detect binding interactions between host or viral
c proteins and HBV nucleic acid. Probes that hybridise to any of the
specified mutated regions are used to detect HBV-related disease,
c specified mutated regions are used combinations of the specified
c serologically fulminant infection, but also severe chronic infection or
c serologically nunsual forms of disease. Combinations of the specified
c mutations are associated with fulminant infections, probably because they
creduce the ability to bind inhibitory proteins in the host cell
                                                                                                                                                                                                                                                                                                          New hepatitis B virus nucleic acid with combination of specific mutations - useful for, e.g. detection of binding interactions between host or viral proteins and HBV nucleic.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                hepatitis B virus; variant; FHBV; HBV; binding interaction;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Fulminant hepatitis B virus genotype D variant FHBV5 sequence.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The present sequence is the DNA sequence of the hepatitis B virus core antigen (HBcAg) gene from HBV serotype ayw. A peptide comprising a HBV composed in claimed methods of the invention for modulating an immune response in a mammal. A method of inducing a systemic immune response to a peptide in a mammal comprises transmucosally administering conformation and peptide. The peptide is a macromolecular aggregate of the peptide. The macromolecular aggregate comprises at least 10 peptide subunits, may have composed a molecular weight of over 1,000 kDa, and is preferably at least 5 nm in diameter. It is resistant to digestive degradation, being stabilised in aggregate form by chemical treatment and/or by recombinant protein caggregate form by chemical treatment and/or by recombinant protein conversed from HBV surface protein, nucleocapsid protein or envelope protein. Transmucosal administration to a mammal of a macromolecular aggregate of a HBV surface protein enganders a systemic immune response in the mammal. A method of suppressing an immune response conversed in the mammal and administration and which may be stabilised by chemical treatment to protein engandering a monomolecular peptide from the induction of conversed to that is resistant to digestive degradation and which may be derived from a HBV protein. A monomolecular peptide is useful for the induction of converse conversed to a systemic immunity is undesirable, e.g.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Modulating a systemic immune response to a peptide in a mammal comprises transmucosally administering a macromolecular aggregate of the peptide.

Hepatitis B virus.

AAV82691;

RESULT 12

ઠે 셤 WO9845421-A2

The present sequence represents part of the genome of a fulminant the paraitis B virus (FHBV) genotype D variant, nucleotides 1000 to 2500. The specification describes Hepatitis B virus (HBV) nucleic acid that has a mutation (i.e. alteration from the normal nucleotide in any of the genotypes A to F) in at least two of the enhancer I region, the negative regulatory element region, the enhancer II core upstream regulatory sequence/ basal core promoter region, or a mutation which leads to an X-peptide amino acid change to Cys or Met. The HBV variants of the invention are used to detect binding interactions between host or viral proteins and HBV nucleic acid. Probes that hybridise to any of the specified mutated regions are used to detect HBV-related disease, New hepatitis B virus nucleic acid with combination of specific mutations - useful for, e.g. detection of binding interactions between host or viral proteins and HBV nucleic. especially fulminant infection, but also severe chronic infection or serologically unusual forms of disease. Combinations of the specified mutations are associated with fulminant infections, probably because they reduce the ability to bind inhibitory proteins in the host cell Disclosure, Fig 5, 85pp, English

New hepatitis B virus nucleic acid with combination of specific mutations - useful for, e.g. detection of binding interactions between host or viral proteins and HBV nucleic.

Disclosure; Fig 5; 85pp; English.

The present sequence represents part of the genome of a fulminant Hepatitis B virus (FHBV) genotype D variant, nucleotides 1000 to 2500. The specification describes Hepatitis B virus (HBV) nucleic acid that has a mutation (i.e. alteration from the normal nucleotide in any of the

especially fulminant infection, but also severe chronic infection or serologically unusual forms of disease. Combinations of the specified mutations are associated with fulminant infections, probably because they reduce the ability to bind inhibitory proteins in the host cell genotypes A to F) in at least two of the enhancer I region, the negative regulatory element region, the enhancer II/ core upstream regulatory sequence/ basal core promoter region, or a mutation which leads to an X-peptide amino acid change to Cys or Met. The HBV variants of the invention are used to detect binding interactions between host or viral proteins and HBV nucleic acid. Probes that hybridise to any of the specified mutated regions are used to detect HBV-related disease,

Wise lab at lowa State University, Ames, IA; 7 day old green seedlings were infected with isolate 5874 of Blumeria grammins f. sp. hordel, and leaves were harvested 24, 48 and 72 hr post-incoulation and snap frozen (Wise). In the TJ Close lab at the University of California, Riverside, total RNA was prepared from each sample pool, equal quantities of all three RNA pools were combined, poly(A) RNA was purified from the mixture, one primary unamplified cDNA library was made, and I million pfu were in vivo excised to give pBluescript SK(-) CDNA phagemids (Chin). Phagemids were plated and picked at the Clemson University Genomics Institute (CUGI) (Begum, Palmer, Frisch, Atkins and Wing). Plasmid DNA preparations, DNA sequencing and sequence analysis were performed at CUGI (Wing, Yu, Frisch, Henry, Simmons, Oates, Rambo, Main). The sequence has been trimmed to remove vector sequence and contains a minimum of 100 bases of phred value 20 or advence and contains an ibbrary preparation and

Direct Submission

Submitted (10-DEC-2000) Trypanosoma brucei genome sequencing

project, Sanger Centre, The Wellcome Trust Genome Campus, Hinxton,

Cambridge CBlo ISA, B-mail: barrell@sanger.ac.uk and

nhl@sanger.ac.uk

Constructed at the Institute for Genomic Research (TIGR),

Rockville, MD. Genomic DNA isolated from a cloned population of

Trypanosoma brucei (TREU927/4 GUTat 10.1) was mechanically sheared

to give a tight size distribution (

4 kb). The v + i method used for the library construction is

described in detail in Smith, H. and venter, J.C. (Making small

insert libraries for whole genome shotgun sequencing projects. In

Genome Sequencing: A Practical Approach, eds. M. Vaudin and B.

Barrell, Oxford University Press, 1999).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  tz82c11.x1 NCI CGAP Panl Homo BapienB cDNA clone IMAGE:2295092 tz82c11.x1 NCI CGAP Panl Homo BapienB cDNA clone IMAGE:2295092 3' similar to gb:J03490 DIHYDROLIPOAMIDE DEHYDROGENASE PRECURSOR HIGHARA);, mRNA Bequence.

/note="Vector: pBlueScript SK(-); Site 1: EcoRl; Site 2:
Xhol; Tissue was supplied by Dr. Fry (Gornell University)
Leaflets and petioles were isolated from 8 week old
greenhouse grown plants. The plants were watered and
fertilized freely. The tissue was immediately frozen in
liquid nitrogen."

The present sequence represents a synthetic oligonucleotide HBV92b which is complementary to a portion of the hepatitis B virus (HBV) RNA. The antisense oligonucleotide may be used to detect the presence of HBV in a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Oligo:nucleotide(s) complementary to hepatitis B virus (HBV) sequences used in the detection and treatment of HBV infection.
                                                                                                                                                                                                                                                                                                                                                                                 Location/Qualifiers

```
The present sequence represents a synthetic oligonucleotide HBV92Mb which is complementary to a portion of the hepatitis B virus' (HBV) RMA. The antisense oligonucleotide may be used to detect the presence of HBV in a sample. The antisense oligonucleotide, and oligonucleotides containing a sequence which is complementary to at least two non- contiguous regions of an HBV uncleic acid, may be used for inhibiting HBV replication in a cell or for the treatment of HBV infection
                                                                                                                                                                                                                                                                                     Oligo:nucleotide(s) complementary to hepatitis B virus (HBV) sequences used in the detection and treatment of HBV infection.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                a

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The present sequence represents a synthetic oligonucleotide HBV-91b which contains a sequence which is complementary to at least two non-contiguous regions of a hepatitis B virus (HBV) nucleic acid. The antisense oligonucleotide may be used to detect the presence of HBV in a sample. The antisense oligonucleotide, and oligonucleotides and oligonucleotide used to the HBV RNA, may be used to apportion of the HBV RNA, may be used for inhibiting HBV replication in a cell or for the treatment of HBV infection
          The present sequence represents a synthetic oligonucleotide HBV-90Mb which contains a sequence which is complementary to at least two noncontiquous regions of a hepatitis B virus (HBV) nucleic acid. The antisense oligonucleotide may be used to detect the presence of HBV in a sample. The antisense oligonucleotide, and oligonucleotides complementary to a portion of the HBV RNA, may be used for inhibiting HBV replication in a cell or for the treatment of HBV infection
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Oligo:nucleotide(s) complementary to hepatitis B virus (HBV) sequences used in the detection and treatment of HBV infection.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             /*tag= a

```
The present sequence represents a synthetic oligonucleotide HBV-91Mb which contains a sequence which is complementary to at least two noncontiguous regions of a hepatitis B virus (HBV) nucleic acid. The antisense oligonucleotide may be used to detect the presence of HBV in a sample. The antisense oligonucleotide, and oligonucleotides complementary to a portion of the HBV RNA, may be used for inhibiting HBV replication in a cell or for the treatment of HBV infection
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Oligo:nucleotide(s) complementary to hepatitis B virus (HBV) sequences used in the detection and treatment of HBV infection.

The antisense oligonucleotide may be used to detect the presence of HBV in a sample. The antisense oligonucleotide, and oligonucleotides complementary to a portion of the HBV RNA, may be used for inhibiting HBV replication in a sell or for the treatment of HBV infection

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The present invention describes a method of screening for an antiviral agent by the protein-priming activity of hepatitis B virus (HBV) DNA polymerase. Also described is developing an antiviral agent with a high selectivity to HBV which can be used for high-throughput screening. The present sequence represents an RNA oligonucleotide which is used in the

The invention relates to modified proteins comprising hepatitis B virus (HBV) core antigen (HBCAg) wherein one or more of the four arginine repeats has been deleted and the protein comprising the C-terminal cysteine of HBCAg. The deleted region may be replaced by an epitope from a protein other than HBCAg, in which case the HBCAg acts as a carrier to present the epitope to the immune system. This chimeric protein or its nucleic acid is useful as a vaccine or in a method of prophylactic or therapeutic vaccination of the human or animal body, particularly against therapeutic vaccination of the human or animal body, particularly against they we constituted a vaccination of the chimeric protein any be used in gene therapy or DNA vaccination protocols. The chimeric protein or its nucleic acid may also be used as the basis of a prophylactic vaccine against a range of diseases, e.g. HBV, hepatitis A virus (HAV), hepatitis C virus (HCV), influenza, foot-and-mouth disease, polio, herpes, rables, acquired immunodeficiency syndrome (AIDS), dengue fever, yellow fever, malaria, tuberculosis, whooping cough, salmonellosis, typhoid, food poisoning,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ö

This invention describes a novel particle (A), comprising a protein coat with a fusion protein (FP), and, inside the coat, a nucleic acid (I) including the sequence for a virus-specific packaging signal (FB) and a structural gene. FP contains a virus protein (VP), a peptide (P) that mediates cell permeability and a heterologous cell-specific binding site (RGD). The invention also describes (I) producing (A) in which FP contains an LHBs (large surface protein of hepatitis B virus (HBV)) and RGD; (2) preparing (A) in which FP contains an HBV core antigen (HBCAG), (P) and RGD; (3) FP; (4) DNA encoding FP; and (5) expression vector containing the DNA of (d). The products of the invention are used in gene therapy of cells and tissues, in vivo or ex vivo. This sequence encodes a fusion protein which is described in the method of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Particle for cell-specific gene delivery, useful in gene therapy, comprises nucleic acid in protein coat that includes a fusion protein of viral protein, permeability peptide and cell-binding site.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The present invention relates to hepatitis B virus (HBV) core antigen (HBCAg) fusion proteins and polynucleotides encoding such proteins. Sequences of the invention are useful in methods of prophylactic or therapeutic vaccination or to manufacture medicaments for prophylactic or therapeutic vaccination of the human or animal body against HBV, e.g. against viral hepatitis. They are also useful as a prophylactic vaccine against e.g. hepatitis c virus, influenca, polio, herpes, rabies, acquired immune deficiency syndrome (AIDS) or foot-and-mouth disease. The present sequence is a DNA encoding hepatitis B virus core antigen (HBCAg)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Hepatitis B (HB) core antigen fusion proteins, useful as vaccines for the prophylactic or therapeutic treatment of humans or animals against e.g. HB virus, viral hepatitis, hepatitis C virus, influenza, or foot-and-
                                                                                                Hepatitis B virus core antigen; HBcAg; prophylactic; viral hepatitis; therapeutic; vaccine; acquired immune deficiency syndrome; influenza; polio; herpes; rabies; AIDS; foot-and-mouth disease; ds.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ö

The response to a peptide in a mammal comprises transmucosally administering to the mammal a macromolecular aggregate of the peptide. The macromolecular aggregate of the peptide The macromolecular aggregate comprises at least 10 peptide subunits, may have macromolecular aggregate comprises at least 10 peptide subunits, may have a molecular weight of over 1,000 kDa, and is preferably at least 5 nm in diameter. It is resistant to digestive degradation, being stabilised in aggregate form by chemical treatment and/or by recombinant protein aggregate form HBV surface protein, nucleocapsid protein or envelope protein. Transmucosal administration to a mammal of a mammal involves transmucosally administration and minimum response in the mammal. A method of suppressing a monomolecular peptide in a mammal involves transmucosally administering a monomolecular peptide that is resistant to digestive degradation and which may be stabilised by chemical treatment or protein engineering, and which may be stabilised by chemical treatment or protein engineering, and which may be derived from a HBV protein. A monomolecular peptide is useful for the induction of oral tolerance when induction of systemic immunity is undesirable, e.g.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ö
                                                                                                                                                                                                                                                                                                                                                                                                                                              The present sequence is the DNA sequence of the hepatitis B virus core antigen (HBcAg) gene from HBV serotype ayw. A peptide comprising a HBV protein can be used in claimed methods of the invention for modulating an immune response in a mammal. A method of inducing a systemic immune
                                                                                                                                                                                                                                                                                                                                                   Modulating a systemic immune response to a peptide in a mammal comprises transmucosally administering a macromolecular aggregate of the peptide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Gaps

Hepatitis B virus

WO9845421-A2

```
The present sequence represents part of the genome of a fulminant
Hepatitis B virus (FHBV) genotype D variant, nucleotides 1000 to 2500.
The specification describes Hepatitis B virus (HBV) nucleic acid that has
a mutation (i.e. alteration from the normal nucleotide in any of the
c quotypes A to F) in at least two of the enhancer I region, the negative
c genotypes A to F) in at least two of the enhancer I region, the negative
c genotypes A to F) in at least two of the enhancer II core upstream region, the negative
c genotypes A to F) in at least two of the enhancer II core upstream region.

C genotypes A to F) in at least two of the enhancer II core upstream region.

C genotypes A to F) in at least two of the enhancer II core upstream region which leads to an X-
peptide amino acid change to Cys or Met. The HBV variants of the
c peptide amino acid change to Cys or Met. The HBV variants of the
c proteins and HBV nucleic acid. Probes that hybridise to any of the
c specified mutated regions are used to detect HBV-related disease,
c specified mutated regions are used to detect HBV-related disease.

C specified mutated forms of disease. Combinations of the specified
c mutations are associated with fulminant infections, probably because they
creduce the ability to bind inhibitory proteins in the host cell
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ö
                                                                                                                                                                                                                New hepatitis B virus nucleic acid with combination of specific mutations - useful for, e.g. detection of binding interactions between host or viral proteins and HBV nucleic.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          hepatitis B virus; variant; FHBV; HBV; binding interaction;

Hepatitis B vius (FHN) genous products and considerable because the specification describes Hepatitis B virus (HBV) nucleic acid that has a mutation (i.e. alteration from the normal nucleic acid that has genotypes A to P) in at least two of the enhancer I region, the negative regulatory element region, the enhancer II/ core upstream regulatory sequence/ basal core promoter region, or a mutation which leads to an X-peptide amino acid change to Cys or Met. The HBV variants of the invention are used to detect binding interactions between host or viral proteins and HBV nucleic acid. Probes that hybridise to any of the specified mutated regions are used to detect HBV-related disease, especially fulminant infection, but also severe chronic infection or serologically unusual forms of disease. Combinations of the specified mutations are associated with fulminant infections, probably because they reduce the ability to bind inhibitory proteins in the host cell New hepatitis B virus nucleic acid with combination of specific mutations - useful for, e.g. detection of binding interactions between host or viral proteins and HBV nucleic. present sequence represents part of the genome of a fulminant Sequence 1395 BP; 277 A; 387 C; 331 G; 398 T; 0 U; 2 Other; Disclosure; Fig 5; 85pp; English

New hepatitis B virus nucleic acid with combination of specific mutations - useful for, e.g. detection of binding interactions between host or viral proteins and HBV nucleic.

Disclosure, Fig 5; 85pp; English

The present sequence represents part of the genome of a fulminant
Hepatitis B virus (FHBV) genotype D variant, nuclectides 1000 to 2500.
The specification describes Hepatitis B virus (HBV) nucleic acid that has
a mutation (i.e. alteration from the normal nucleotide in any of the
genotypes A to F) in at least two of the enhancer I region, the negative
cequence/ basal core promoter region, or a mutation which leads to an Xpeptide amino acid change to Cys or Met. The HBV variants of the
peptide amino acid change to Cys or Met. The HBV variants of the
ceptide amino acid detect binding interactions between host or viral
proteins and HBV nucleic acid. Probes that hybridise to any of the
specified mutated regions are used to detect HBV-related disease,
specified mutated regions are used combinations of the specified
serologically fulminant infection, but also severe chronic infection or
serologically nunsual forms of disease. Combinations of the specified
mutations are associated with fulminant infections, probably because they
reduce the ability to bind inhibitory proteins in the host cell

Wise lab at Iowa State University, Ames, IA; 7 day old green seedlings were infected with isolate 5874 of Blumeria grammlis f. sp. hordel, and leaves were harvested 24, 48 and 72 hr post-inoculation and snap frozen (Wise). In the TJ Close lab at the University of California, Riverside, total RNA was prepared from each sample pool, equal quantities of all three RNA pools were combined, poly(A) RNA was purified from the mixture, one primary unamplified cDNA library was made, and 1 million pfu were in vivo excised to give pBluescript SK(-) cDNA phagemids (Chin). Phagemids were plated and picked at the Clemson University Genomics Institute (CUGI) (Begum, Palmer, Frisch, Aktins and Wing). Plasmid DNA preparations, DNA sequence has been trimmed to remove vector sequence and contains a minimum of 100 bases of phred value 20 or above. For more details on library preparation and sequence analysis sequence analysis sequence and interval.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ö

The cDNA library was constructed from mRNA isolated from lag (9 h), log (72 h) and stationary (7 days) old Br-2 cells.

Seq primer: M13 forward.

Constructed at the Institute for Genomic Research (TIGR),
Constructed at the Institute for Genomic Research (TIGR),
Rockville, MD. Genomic DNA isolated from a cloned population of
Trypanosoma brucei (TREU927/4 GUTAT 10.1) was mechanically sheared
to give a tight size distribution (
4 kb). The v + i method used for the library construction is
described in detail in Smith, H. and Venter, J.C. (Making small

```
The present sequence represents a synthetic oligonucleotide HBV101Mb which is complementary to a portion of the hepatitis B virus (HBV) RNA. The antisense oligonucleotide may be used to detect the presence of HBV in a sample. The antisense oligonucleotide, and oligonucleotides containing a sequence which is complementary to at least two noncontiguous regions of an HBV nucleic acid, may be used for inhibiting HBV replication in a cell or for the treatment of HBV infection
